SMIC 55nm LL Logic Process

Version 1.3.a

OVERVIEW

The General Dual-Port SRAM(BW) is designed for SMIC's 55nm CMOS Logic process. The memory is optimized for speed, power and area. It operates at a voltage range of 1.08V to 1.32V and a temperature range of -40°C to 125°C.

The write enable (WENA,WENB), bit-write enalbe (BWENA[n-1:0], BWENB[n-1:0]), chip enable(CENA,CENB), address(AA[i-1:0],AB[i-1:0]) and data in (DA[n-1:0],DB[n-1:0]) signals are latched on the rising-edge of the clock(CLKA,CLKB). When CENA(CENB) is low and WENA(WENB) is high the menory will be in read oprarion. When CENA(CENB) and WENA(WENB) are both low and BWENA[j](BWENB[j]) is high, the memory will be in read operation. By address AA[i-1:0](AB[i-1:0]) the data is read and output on the port QA[j](QB[j]). When CENA(CENB) and WENA(WENB) are both low and BWENA[j](BWENB[j]) is low, the memory will be in write operation. Data on DA[j](DB[j]) would be written through AA[i-1:0](AB[i-1:0]) and then be output on QA[j](QB[j]).When CENA(CENB) is high the memory is in standby mode. Meanwhile, the data stored in memory is retained but cannot be read or written.

CONFIGURATION:

PARAMETER	VALUE
Mux	8
Words	4096
Bits	12
Width	252.4um
Height	319.25um
